CadPad™
Mortuary Pads

Highly absorbent non-drip pads for use in funeral directors, mortuaries, hospices and hospitals
CadPad™ Mortuary Pads

**CadPad™ Mortuary Pads** are specially designed for use within funeral directors, mortuaries, hospices and hospitals. These pads are highly absorbent and can absorb a considerable amount of body fluids without dripping.

**CadPad™ pads** are perfect for absorbing body fluids or for cleaning up any other spills and can be used in a variety of situations including:

- In a coffin or in Flexmort’s CadSeal system
- Under the deceased on body trays or trolleys
- Within deceased recovery packs
- General cleaning of spills

Unlike traditional absorbent wipes, the fluid is locked away inside and does not leak or drip.

This is scientifically proven to reduce bacteria as the CadPad™ system removes the water which bacteria require to proliferate.

**How does it work?**

CadPad™ pads contain a patented core with a matrix of cellulose fibres combined with polyacrylic superabsorbent to absorb and chemically retain aqueous fluid.

The core is then encapsulated between outer layers.

The cellulose acts as a wick to draw fluid to the polyacrylate where it is chemically bound into a gel, thus preventing rewetting, even under pressure.

**Sizes**

Our pads come in two sizes, 24cm x 36cm and 60cm x 90cm.

The pads can hold approximately 1.5 litres of body fluid, which can increase depending on the water content of the fluid.

www.flexmort.com
The traditional absorbent pads we use are not very absorbent and this means we often use several pads to mop up body fluid.

Furthermore, the pads don’t actually lock the fluid away so when we take the pad to the bin, it usually drips which then means we have the risk of contaminated body fluids on the floor (which is not good for infection control).

The use of the non-dripping highly absorbent CadPad pads are of considerable benefit to ourselves. We use the pads when we have to dress the deceased’s wounds which could leak in coffins. We also use them for to rest the heads of deceased in body storage units to stop leakage on trays etc.”
